Benzinmåler universal.

Pris kr. 1.000 ,-

HOW IT WORKS

The fuel level Sensor is connected to the fuel hose under the fuel tank. The fuel causes hydrostatic pressure measured by the Sensor. The data from this pressure sensor are evaluated by a microcomputer, which compares it to the data in its memory (the memory is set up during calibration) and then shows the current amount of fuel on the display. Therefore, you don't need any float or other modification to the fuel tank. The microcomputer makes many other minor operations to ensure that even in hard terrain with fast level changes, the amount of fuel showed on the display is "clean" and stable.

Sælgers beskrivelse

Universal Brændstofmåler til Motorcykel, bil, båd, havetraktor osv osv.. Er din cykel ikke udstyret med brændstofmåler, så er her løsningen. DER SKAL IKKE MONETRES NOGET I TANKEN.! Eneste indgreb er, at montere et T-stykke i benzinslangen. Sensoren måler trykket i benzinslangen, og kalibreres ganske let til netop DIN cykel. Helt ny, har aldrig været monteret. (jeg solgte cyklen inden jeg fik mig taget sammen ?) Med digital bar-graph display. Systemet fås ikke længere! Se mere info her...: <https://www.lskelectronics.com/fuelgaugepro1>
